

Problem set 4

2025-10-05

In the next problem set, we plan to explore the relationship between COVID-19 death rates and vaccination rates across US states by visually examining their correlation. This analysis will involve gathering COVID-19 related data from the CDC's API and then extensively processing it to merge the various datasets. Since the population sizes of states vary significantly, we will focus on comparing rates rather than absolute numbers. To facilitate this, we will also source population data from the US Census to accurately calculate these rates.

In this problem set we will learn how to extract and wrangle data from the data US Census and CDC APIs.

1. Get an API key from the US Census at https://api.census.gov/data/key_signup.html. You can't share this public key. But your code has to run on a TFs computer. Assume the TF will have a file in their working directory named `census-key.R` with the following one line of code:

```
census_key <- "A_CENSUS_KEY_THAT_WORKS"
```

Write a first line of code for your problem set that defines `census_key` by running the code in the file `census-key.R`.

```
source("census-key.R")  
#This line of code tells R to run the census key and loads it.
```

2. The [US Census API User Guide](#) provides details on how to leverage this valuable resource. We are interested in vintage population estimates for years 2021 and 2022. From the documentation we find that the *endpoint* is:

```
url <- "https://api.census.gov/data/2021/pep/population"
```

Use the **httr2** package to construct the following GET request.

```
https://api.census.gov/data/2021/pep/population?get=POP_2020,POP_2021,NAME&for=state:*&key=Y
```

Create an object called `request` of class `httr2_request` with this URL as an endpoint. Hint: Print out `request` to check that the URL matches what we want.

```
library(httr2)

url <-paste0(url,                                #endpoint
  "?get=POP_2020,POP_2021,NAME",                #requested variables, vintage population estimate 2
  "&for=state:*",                               #requested range
  "&key=", census_key                           #the local key
)
#doing so create the full url that runs on any laptop with the specified key

request <-request(url)                          #create a request
```

3. Make a request to the US Census API using the `request` object. Save the response to an object named `response`. Check the response status of your request and make sure it was successful. You can learn about *status codes* [here](#).

```
response <- request |> req_perform()            #perform the actual request
```

4. Use a function from the `httr2` package to determine the content type of your response.

```
resp_content_type(response)
```

```
[1] "application/json"
```

```
#check the content
```

5. Use just one line of code and one function to extract the data into a matrix. Hints: 1) Use the `resp_body_json` function. 2) The first row of the matrix will be the variable names and this OK as we will fix in the next exercise.

```
population <- resp_body_json(response, simplifyVector = TRUE)
#without simplifyVector = TRUE, we would need to do do.call(rbind,...) to manually combine a
#with simplifyVector = TRUE, we convert the lists into a matrix. We can do this because each
population

- Examine the `population` matrix you just created. Notice that 1) it is not tidy, 2) the column types are not what we want, and 3) the first row is a header. Convert `population` to a tidy dataset. Remove the state ID column and change the name of the column with state names to `state_name`. Add a column with state abbreviations called `state`. Make sure you assign the abbreviations for DC and PR correctly. Hint: Use the **janitor** package to make the first row the header.

```
library(tidyverse)
library(janitor)

population <- population |>
  row_to_names(row_number = 1) |> #use first row as header
  as_tibble() |> #turn into tibble
  select(-state) |> #remove state
  rename(state_name=NAME) |> #rename NAME
  pivot_longer( #turn wide format into long
    cols = starts_with("POP_"),
    names_to = "year",
    values_to = "population"
  ) |>
  mutate(
    year = str_remove(year, "POP_"), #remove the extra characters from
    year = as.numeric(year),
    population = as.numeric(population)
  ) |>
  mutate(
    state = case_when(
      state_name == "District of Columbia" ~ "DC",
      state_name == "Puerto Rico" ~ "PR",
      TRUE ~ state.abb[match(state_name, state.name)] #state.abb <-returns abbreviation
    )
  )
```

```

    )
  )

7. As a check, make a barplot of states' 2021 and 2022 populations. Show the state names in the y-axis ordered by population size. Hint: You will need to use **reorder** and use **facet_wrap**.

```

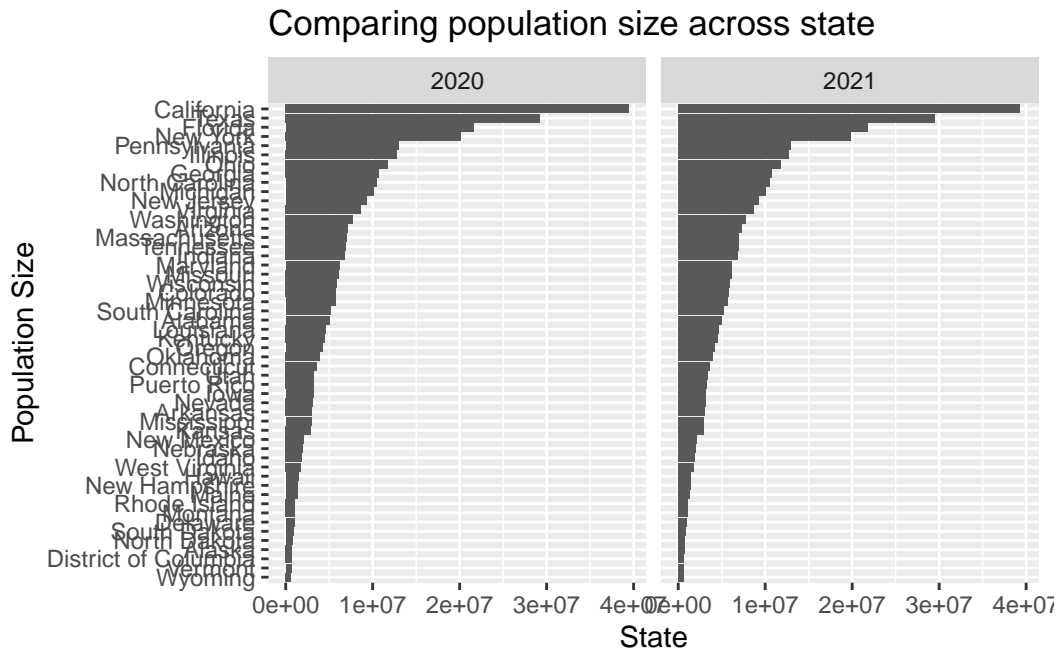

population |>
  mutate(state_name = reorder(state_name, population)) |> #reorder the state_name by pop
  ggplot(aes(x=state_name,y=population))+
    geom_col()+
    coord_flip() + #flip coordinates

```

    facet_wrap(~year) +
    labs(
      x = "Population Size",
      y = "State",
      title = "Comparing population size across state"
    )

```

```

# population |>
# reorder state
# assign aesthetic mapping
# use geom_col to plot barplot
# flip coordinates
# facet by year

8. The following URL:

```
url <- "https://github.com/datasciencelabs/2025/raw/refs/heads/main/data/regions.json"
```

points to a JSON file that lists the states in the 10 Public Health Service (PHS) defined by CDC. We want to add these regions to the `population` dataset. To facilitate this create a data frame called `regions` that has two columns `state_name`, `region`, `region_name`. One of the regions has a long name. Change it to something shorter.

```
library(jsonlite)
library(purrr)
url <- "https://github.com/datasciencelabs/2025/raw/refs/heads/main/data/regions.json"
regions <- fromJSON(url,simplifyDataFrame = FALSE) #read json file, return lists as

regions <- map_df(regions, as_tibble)|> #turn the list into tibble
  rename(state_name=states)|>
  #rename the column names to match population's column name
  filter(state_name %in% c(state.name, "District of Columbia", "Puerto Rico"))
  #without filter, the original data would be 59x3

regions
```

```

# i 42 more rows
```

```
# regions <- use jsonlit JSON parser
# regions <- convert list to data frame. You can use map_df in purrr package

10. From reading <https://data.cdc.gov/> we learn the endpoint <https://data.cdc.gov/resource/pwn4-m3yp> provides state level data from SARS-COV2 cases. Use the **httr2** tools you have learned to download this into a data frame. Is all the data there? If not, comment on why.

We see exactly 1,000 rows. We should be seeing over 52×3 rows per state.

- The reason you see exactly 1,000 rows is because CDC has a default limit. You can change this limit by adding `$limit=10000000000` to the request. Rewrite the previous request to ensure that you receive all the data. Then wrangle the resulting data frame to produce a data frame with columns `state`, `date` (should be the end date) and `cases`. Make sure the cases are numeric and the dates are in Date ISO-8601 format.

```
api <- "https://data.cdc.gov/resource/pwn4-m3yp.json"
cases_raw <- request(api)|>
  req_url_query(`$limit` = "10000000000") |> #added limit in the query
  req_perform()|>
  resp_body_json(simplifyVector = TRUE)

library(lubridate)

cases<- cases_raw|>
  select(state,end_date,new_cases) |>
  rename(date=end_date,cases=new_cases) |> #rename the columns
  mutate(cases=as.numeric(cases), #make sure cases are numeric
         date = as.Date(date)) #as.Date turns into ISO-806
cases
```

12. For 2020 and 2021, make a time series plot of cases per 100,000 versus time for each state. Stratify the plot by region name. Make sure to label you graph appropriately.

```
cases|>

  mutate(year = year(date)) |>                       #add a year column in cases for
  left_join(population,by = c("state","year")) |>
  mutate(cases_rate= (cases/population)*100000) |>    #calculate the rate as requested
  filter(!is.na(region_name))|>
  ggplot(aes(x=date, y=cases_rate,col=state))+

- The dates in the `cases` dataset are stored as character strings. Use the **lubridate** package to properly parse the `date` column, then create a summary table showing the

total COVID-19 cases by month and year for 2020 and 2021. The table should have columns for year, month (as month name), and total cases across all states. Order by year and month. Use the **knitr** package and **kable()** function to display the results as a formatted table.

```
library(lubridate)
library(knitr)

  filter(year(date) %in% c(2020, 2021)) |> #filter to only 2020 and 21
  mutate(year = year(date),                #create month and year
         month = month(date)) |>
  group_by(year,month)|>
  summarize(total=sum(cases,na.rm=TRUE),    #calculate the sum for each month

14. The following URL provides additional COVID-19 data from the CDC in JSON format:

```
deaths_url <- "https://data.cdc.gov/resource/9bhg-hcku.json"
```

Use **httr2** to download COVID-19 death data from this endpoint. Make sure to remove the default limit to get all available data. Create a clean dataset called **deaths** with columns **state**, **date**, and **deaths** (renamed from the original column name). Ensure dates are in proper Date format and deaths are numeric.

```
deaths_raw <- request(deaths_url) |>
  req_url_query(`$limit` = 1000000000) |>      #like previous question, set the limit high to

- Using the `deaths` dataset you created, make a bar plot showing the total COVID-19 deaths by state. Show only the top 10 states with the highest death counts. Order the bars from highest to lowest and use appropriate labels and title.

```

death|>
  group_by(state)|>
  summarize(total=sum(deaths,na.rm=TRUE),          #calculate the total death by state
             .groups="drop")|>
  arrange(desc(total))|>
  slice_head(n = 10) |>                          #arrange by descending+grab the top 10
  ggplot(aes(x=reorder(state,total),y=total)) +
  geom_col()+
  coord_flip()+
  labs(
    title ="TOP 10 States",
    x ="Total Deaths",
    y = "State"
  )

```
